CAITE — DAY 3 JOB AID

BUILD YOUR PRESENTATION AND PREPARE YOUR LEARNING VIDEO

Use this guide while creating your materials with AI.

TODAY'S TWO WORKSTREAMS

PRESENTATION PRACTICE

Live-session outline → Slide content → Gamma presentation → Review and practice

CAPSTONE PREPARATION

Course outline → Video narration → Timed scene plan → Image assets

---

The presentation is a separate practice output. Your course outline, video script, and scene plan support your Rise capstone.

PART 1 — CREATE YOUR PRESENTATION

1. START WITH YOUR REVIEWED OUTLINE

Use your Day 2 facilitated-presentation outline.

Confirm:

- [ ] Who the audience is.
- [ ] What learners should be able to do.
- [ ] Which two objectives the presentation supports.
- [ ] What example will make the topic clear.
- [ ] What learners will practice.

For this workshop, create seven slides for a 15-minute facilitated session.

2. ASK AI FOR SLIDE CONTENT FIRST

A useful seven-slide structure:

1

Open with a relevant situation or question.

2

Explain the first essential idea.

3

Show a concrete example.

4

Explain and demonstrate the next idea.

5

Let learners apply what they learned.

6

Discuss a suggested answer.

7

Close with a practical checklist.

Adapt the structure to your topic. Keep the activity connected to the objectives.

COPY-AND-PASTE PROMPT — DRAFT MY PRESENTATION

Use my facilitated-course outline to create seven slides for a 15-minute live session.

Keep my audience, topic, and two learning objectives.

For each slide, provide:

- A clear title.
- Exact on-slide text.
- A useful visual.
- Estimated time.

Include a concrete example, a short learner activity, a suggested answer with an explanation, and a practical takeaway.

For the activity, include the situation, instructions, response method, and time allowed.

Make the timings total 15 minutes, including participation and discussion.

Keep the language clear and slide text brief. Do not include presenter notes. Do not invent facts or organizational policies. Label fictional examples.

3. GENERATE THE DECK IN GAMMA

Review the slide content before using it.

Copy the reviewed content into Gamma with this instruction:

> Create exactly seven slides using the content below.
>
> Use a 16:9 landscape format, readable text, strong contrast, consistent spacing, and clear titles.
>
> Use visuals that explain the content: annotated examples, comparisons, diagrams, or simple process illustrations.
>
> Keep essential text editable. Preserve the examples and activity instructions. Do not invent facts or add presenter notes.
>
> Avoid crowded slides. Do not shrink text to fit.
>
> The deck must remain understandable without animation.
>
> **Slide content:**
>
> [Paste your reviewed slide content.]

4. CHECK THE GENERATED DECK

Check meaning before decoration.

- [ ] Is the example accurate?
- [ ] Can learners understand the activity without guessing?
- [ ] Does the answer explain the reasoning?
- [ ] Does each visual help explain something?
- [ ] Can you read the slide comfortably in presentation view?
- [ ] Can you explain the slide in your own words?

If a slide is unclear, revise that slide directly.

QUICK REPAIR PROMPT

Revise Slide [number].

The main point is: [state it].

The problem is: [describe it].

Keep: [essential information].

Make the explanation and visual clearer. Preserve the meaning, use readable text, and change only this slide.

PART 2 — PREPARE YOUR CAPSTONE VIDEO

1. CONFIRM THE VIDEO'S PLACE IN THE COURSE

Use the reviewed 15-minute capstone outline.

Choose:

- [ ] One focused video topic.
- [ ] The learning objective it supports.
- [ ] A target duration between 3 and 5 minutes.
- [ ] The task learners will complete after watching.

The video duration is included in the course total.

2. DRAFT THE NARRATION

Write what the audience should hear before deciding what every image will look like.

A simple narration structure:

Opening:

Introduce the task or problem.

Explanation:

Explain the essential idea.

Demonstration:

Walk through a concrete example.

Closing:

Recap the useful steps and connect to the next activity.

COPY-AND-PASTE PROMPT — WRITE MY VIDEO NARRATION

Use my reviewed course outline and approved source material.

Write narration for one learning video.

Topic: [insert]

Audience: [insert]

Learning objective supported: [insert]

Target duration: [3–5 minutes]

Language and tone: [insert]

Use natural spoken language, a concrete example, and a short practical recap.

Write only the words to be spoken. Do not add camera directions or image prompts yet.

Use approximately 120–140 words per minute as an initial estimate, allowing for pauses. State the estimated word count and duration.

Do not invent facts or policies. Clearly identify fictional examples and flag details requiring confirmation.

3. READ THE SCRIPT ALOUD

Check:

- [ ] Does it sound like something you would actually say?

- [ ] Are unfamiliar terms explained?

- [ ] Is the example easy to follow?

- [ ] Are the facts correct?

- [ ] Does it fit the target duration?

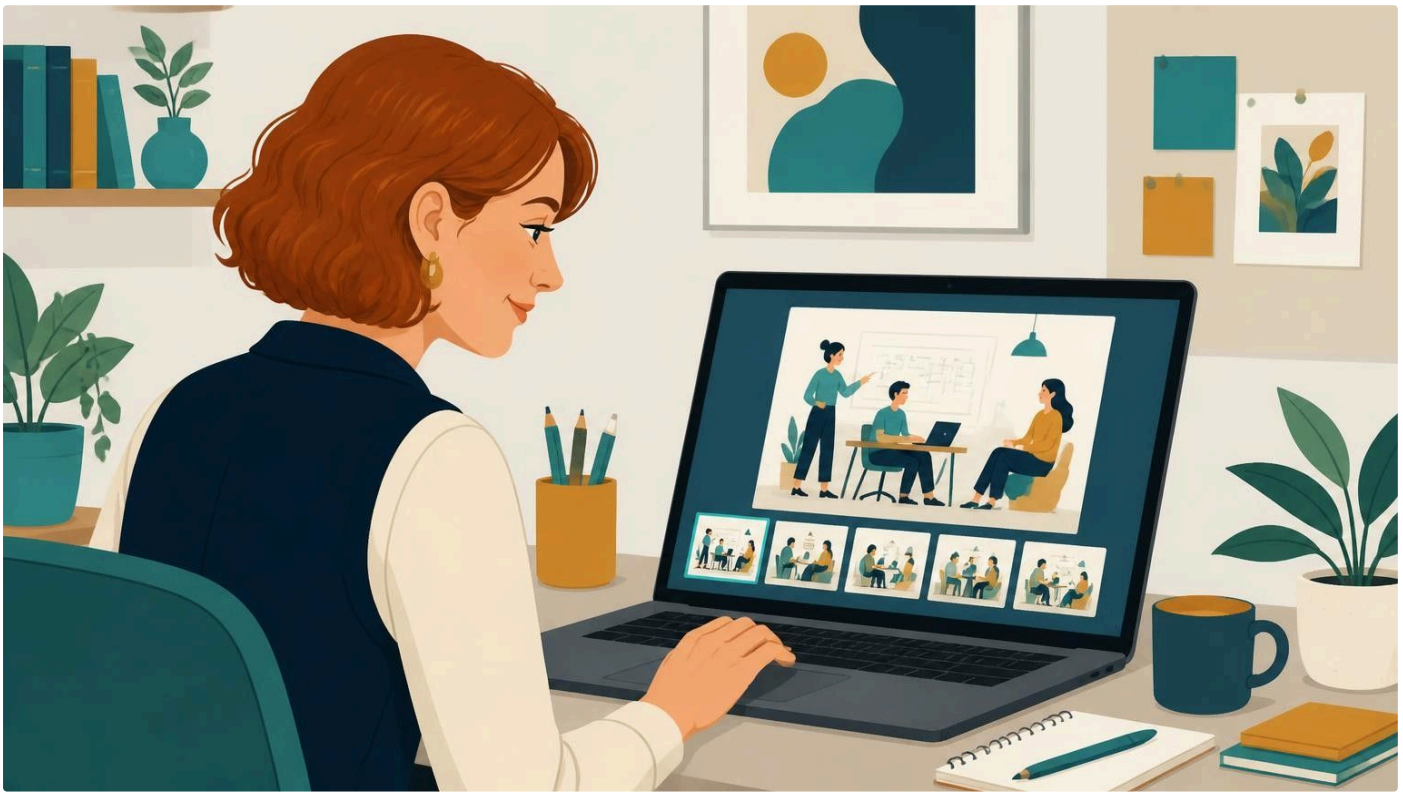

If it runs long, simplify the explanation. Do not rely on speaking faster.

Approve the narration before creating the scene plan.

4. CHOOSE A VISUAL STYLE

Choose one overall style, such as:

- Clean flat illustrations.
- Realistic workplace images.
- Annotated screenshots.
- Simple diagrams.

You may combine photographs, diagrams, and screenshots when useful. Keep colors, labels, typography, and treatment consistent.

If a character appears more than once, repeat the same character description in each image prompt.

5. TURN THE SCRIPT INTO SCENES

A scene represents a meaningful idea or action. It does not need to change with every sentence.

Use these seven columns:

- Scene ID
- Time range
- Exact narration
- What viewers see and asset source
- Visual style
- Image generation prompt
- Asset filename

Use the full scene-planning prompt in your Day 3 workbook.

SCENE-PLANNING CHECK

- [ ] Scene IDs run S01, S02, S03, and so on.
- [ ] Timing starts at 00:00 and continues without gaps or overlaps.
- [ ] All approved narration appears once, in the correct order.
- [ ] The planned duration matches the approved target.
- [ ] Each visual explains the narration.
- [ ] Existing or reused assets are identified.
- [ ] New AI images have complete prompts.
- [ ] Each unique asset has a filename.
- [ ] Timing will be checked against the recorded narration.

Paste the scene table directly into your workbook. There is no need to transfer it to another application.

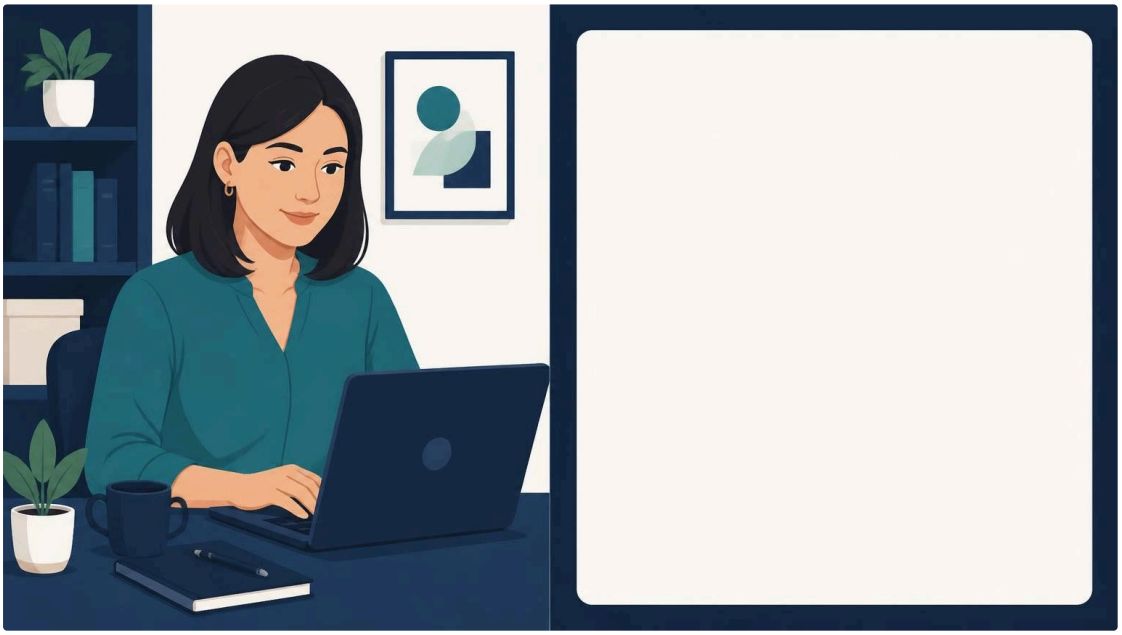

6. WRITE USEFUL IMAGE PROMPTS

Include:

Subject + Action or arrangement + Setting + Composition + Style + Consistent details + Aspect ratio

Example:

> “Create a clean flat illustration of an employee reviewing an email on a laptop in a simple office. Place the employee on the left and a large blank message panel on the right for labels to be added later. Use navy, teal, and off-white, with minimal background detail and strong contrast. Use 16:9 landscape framing. Do not generate written text.”

Add exact labels later as editable text.

Use a diagram or screenshot when it explains the topic better than a generated photograph.

7. PREPARE AND SAVE YOUR ASSETS

Generate or gather the images specified in the scene table.

Check each asset:

- [ ] Does it show the intended idea?
- [ ] Are important details accurate?
- [ ] Is its style consistent?
- [ ] Is there room for labels?
- [ ] Is it clear at presentation or video size?

Save using the filenames from your plan:

- S01_opening.png
- S02_example.png
- S03_summary.png

If a later scene reuses an image, keep the original filename.

Do not generate a new image merely because another scene begins.

FINAL CHECK — WHAT YOU SHOULD HAVE

Presentation practice:

- [ ] A reviewed seven-slide deck.
- [ ] A clear example and activity.
- [ ] A saved link or editable file.

Capstone preparation:

- [ ] A reviewed course outline.
- [ ] An approved 3–5-minute narration.
- [ ] A timed scene table.
- [ ] An organized list or folder of planned assets.

REMEMBER

A useful AI-generated material is one you can explain, your learners can understand, and they can use to perform the intended task.
